

## Harvest Data Correction Tool Instructions

To download the Harvest Correction Tool, please follow the instructions provided below:

1. Go to [www.StellarSupport.com](http://www.StellarSupport.com) select the Support & Downloads tab on the left hand side.
2. In the Software Downloads section select the “Harvest Correction Tool” link.
3. Select the “Download the Apex 2.1 Harvest Yield Data Correction Tool” link.
4. The “File Download” box will appear asking you if you want to run or save the file.
5. Select “Save” and the “Save As” window will appear asking for a location to save the file. Specify the desktop for the location.
6. Select “Save” and the file will be saved to your desktop.

## To Correct your Harvest Data

**If at anytime you need assistance with downloading and using the Harvest Correction Tool, please contact the Customer Contact Center at 1-888-476-7827 to speak to a technician.**

If you have already cleaned the data from your card containing the harvest data without making a copy of the card, please contact the Customer Contact Center for assistance with correcting your data.

1. Make a backup of your Apex data using the Apex Backup and Restore program. Please refer to the Apex Backup and Restore section in the Apex Help Guide for more information.
2. It is highly recommended that you create a copy of your data on you data card prior to using the Harvest Data Correction Tool.
3. Locate the Harvest Correction Tool on your desktop. The tool will have the same appearance as the Apex icon and will be named GSDFileFixer.exe.
4. Double click on the GSDFileFixer.exe icon to open the tool. The following window will be displayed.

5. In the box named “Location of files to fix” select the ellipsis button  to locate the files containing the harvest data. Click on the drive letter of your data card then single left click on the **pfdata** folder and select “OK.”

**If you see folders named “CL0xxxx” and do not have a “pfdata” folder on the root of your card drive please contact the Customer Contact Center at 1-888-476-7827**

6. Create a **pfdata** folder on the C: drive of your computer. In the box named “Location to place fixed files” select the ellipsis button . This will open the “Browse For Folder” window. Single left click to highlight the C: drive and then select the “Make New Folder” button at the bottom left of the window. Name the new folder **pfdata** then select “OK.”
7. Select the “Fix Files” button to execute the program. In the lower left of the File Fixer window, you will see the file names flash very quickly then it will read “Done” when the tool is finished.
8. When finished fixing the files, select the “Close” button to close the tool.
9. Open your Apex program; select the “Unload” icon  to unload the corrected harvest data from the C: drive.
10. In the “Card Options” window on left side of the screen select “Original GreenStar” and select C:\ in the dropdown. Apex will automatically locate the **pfdata** folder on the C: drive.
11. Select the “Unload” button  to unload your corrected files into Apex.
  - You may notice the files on the unload screen show as numbers rather than the correct names. This is because the setup data from the card is not at the location of your fixed files. While unloading these files Apex will direct the files to the correct Client, Farm, and Field.
